19	CF_015	<p>Napkins</p> <p>A napkin is a small square of cloth or paper used at the table for wiping the mouth while eating, or in the bathroom for wiping the bloody hunks of endometrium during sudden, violent menses. The word is from Middle English, borrowing the French nappe—a cloth covering for a table—and adding -kin, the diminutive suffix.</p> <p>Conventionally the napkin is folded and placed to the left of the place setting, outside the outermost fork. In an ambitious restaurant setting or a caterer's hall, it may be folded into more or less elaborate shapes and displayed on the empty plate.</p>	54,00	10.355,00
20	CM_012	<p>Plastic forks</p> <p>As a cutlery or kitchenware, a fork is a tool consisting of a handle with several narrow tines (usually two to four) on one end. Forks are used to move or hold pieces of food in place. The fork is sometimes referred to as the "king of utensils." <i>Originally, the fork was used as an eating utensil primarily in the West, whereas in East Asia chopsticks were more prevalent. Today, however, forks are increasingly available throughout East Asia as well.</i></p> <p>The utensil (usually metal) is used to lift food to the mouth or to hold food in place while cooking or cutting it. Food can be lifted either by spearing it on the tines, or by moving it on top of the fork , and holding it atop the tines</p>	125,00	2.500,00

8	CM_011	<p>horizontally. To allow for this spoon-like use the tines are often curved slightly upward.</p> <p>Plastic knives is a sharp-edged hand tool used for cutting. A knife usually consists of a blade, commonly less than 12 inches (30cm) in length, attached to a handle. The blade of a knife is usually pointed and may have one or two cutting edges. Knives have been used as tools and weapons since the Stone Age, in the dawn of humanity. Specialists recognize the knife as one of the first tools designed by the man in order of help to survive.</p>  <p>The first knives were flint or other rock, chipped or ground to an edge, sometimes with a handle. Later on with advances in smelting and metallurgy the blades were made of bronze, iron, then steel. While the materials have changed over time, the basic design remains the same.</p>	125,00	1.000,00
